Say X is a continuous uniform random variable if X has a constant density on the interval where X has its density nonzero, Say [a,b]. The density, then, must be  $f_X(x) = \frac{1}{b-a}$  on that interval and O otherwise, because we need  $1 = \int_{-\infty}^{\infty} f_X(x) dx = \int_{a}^{b} \int_{a}^{b} dx = const-(b-a)$ So the density looks like:

1 to  $f_X(x)$ 

What about the CDF, Fx(x1?

$$F_{X}(x) = \begin{cases} \frac{X-a}{b-a} & \text{for } a < x < b \\ 0 & x \le a \\ 1 & x \ge b \end{cases}$$
